Specific gravities of a selection of beverages and other liquid foods

Specific gravity and ingredients
If you have a liquid ingredient, the specific gravity value is used to convert the volume of this liquid ingredient to a gram weight. The NPC does this automatically by multiplying the volume (in mL) by the specific gravity of the liquid ingredient. It needs to do this to calculate a nutrition information panel correctly.

Specific gravity and the nutrition information panel
Paragraph 5(1)(b) of Standard 1.2.8 requires that the average quantity of a beverage or other liquid food in a serving must be expressed in millilitres in your nutrition information panel. A specific gravity value is required to convert the nutrient values present in a 100 g portion of a liquid food to 100 mL, for inclusion on your nutrition information panel.

About specific gravities
The specific gravity can vary for a number of reasons. Generally, the specific gravity increases with the amount of solids (e.g. sugars) and decreases with the amount of alcohol and fat present in a liquid, or air present in a whipped ingredient. It can also vary with the temperature of the ingredient. It may be influenced by the packing of the food in the measuring vessel.

About the specific gravities listed here
The specific gravities provided here have been derived from several recognised literature sources and are exactly the same as those provided in the NPC. These values are indicative only, and are provided solely as a guide. It is better to calculate your own. The Explanatory Notes tells you how.
