Cloning and Characterization of the DNA Sequence for the Insert and Its Flanking Border Regions of DAS-44406-6 Soybean

SUMMARY

Soybean (*Glycine max* L.) event DAS-44406-6 was generated by integration of the T-DNA from plasmid pDAB8264 through *Agrobacterium*-mediated transformation. The T-DNA of plasmid pDAB8264 contains three plant transcription units (PTUs): 1) Histone H4A748 promoter, *2mEPSPS* gene, and Histone H4A748 3' UTR, 2) AtUbi10 promoter, *aad-12* gene, and AtuORF23 3' UTR, 3) CsVMV promoter, *pat* gene, and AtuORF1 3' UTR. In addition, a RB7 matrix attachment region (RB7 MAR) is located at the 5' end of the T-DNA insert.

In total, 13659 bp of genomic DNA sequence from DAS-44406-6 soybean was cloned, sequenced, and confirmed. The cloned sequences were comprised of 1494 bp of 5' flanking border sequence, 1885 bp of 3' flanking border sequence, and 10280 bp of the T-DNA insert from plasmid pDAB8264. Sequence analysis confirmed that DAS-44406-6 soybean contains a single T-DNA insert including the RB7 element as well as an intact copy of each of the *2mEPSPS*, *aad-12* and the *pat* expression cassettes. The analyzed sequences revealed a three base pair insertion at the 5' end integration junction and no nucleotide changes in coding regions when compared to the expected T-DNA insert. Sequence analysis did not revealed any novel open reading frames (≥ 450 bp, 150 aa) spanning the junctions resulting from the T-DNA insertion.

BLASTn search of both the 5' and 3' flanking border sequences against the soybean scaffold sequence collection, a sequence assembly of soybean genome from William 82, indicated their identity with a segment in soybean chromosome 6 (Genbank Accession: CM000839.1). Additionally, the T-DNA insertion site was characterized by cloning a 7762 bp genomic fragment from the non-transgenic soybean genome containing the identified flanking border sequences in DAS-44406-6 soybean. The sequence analysis revealed a 4383-bp deletion from the parental locus at the integration site in DAS-44406-6 soybean. Further analysis identified an

open reading frame within the deleted region. However, BLASTp search of the identified endogenous open reading frame revealed no amino acid similarity to known proteins included in the GenBank non redundant protein sequences. Overall, the single insertion in soybean event DAS-44406-6 is located in the chromosome 6 of soybean and a 4383 bp fragment was deleted from the parental locus as a result of the T-DNA integration, but no evidence indicates disruption or deletion of endogenous gene or regulatory element at the insertion locus.

INTRODUCTION

Soybean (*Glycine max* L.) event DAS-44406-6 was generated by integration of the T-DNA from plasmid pDAB8264 through *Agrobacterium*-mediated transformation. The T-DNA of plasmid pDAB8264 contains three plant transcription units (PTUs): 1) Histone H4A748 promoter, *2mEPSPS* gene, and Histone H4A748 3' UTR, 2) AtUbi10 promoter, *aad-12* gene, and AtuORF23 3' UTR, 3) CsVMV promoter, *pat* gene, and AtuORF1 3' UTR. In addition, a RB7 matrix attachment region (RB7 MAR) is located at the 5' end of the T-DNA insert.

Southern analysis indicated that DAS-44406-6 soybean contained a single insert of the T-DNA containing an intact copy of each of the *2mEPSPS*, *aad-12* and *pat* expression cassettes along with the RB7 element (Poorbaugh, 2011 unpublished). Cloning and sequence analysis of the T-DNA insert and its flanking borders allows for the verification of the DNA sequence and identification of the insertion locus in the soybean genome. The junction regions between the insert and its flanking border sequences can also be utilized for the development of event-specific identification methods to detect the presence of DAS-44406-6 soybean. This report describes the cloning and characterization of the DNA sequence of the T-DNA insert and the associated flanking border regions in DAS-44406-6 soybean, as well as the parental locus from non-transgenic soybean variety Maverick.

MATERIALS AND METHODS

Test Substance

The test substance in this study was DAS-44406-6 soybean. Transgenic soybean seeds for DAS-44406-6 were provided by the Department of TPD (Trait Product Development) in Dow AgroSciences (Table 1).

Control Substance

The negative control substances used in this study was the non-transgenic soybean line, Maverick. The unmodified plant has a genetic background representative of the test substance lines, but does not contain the genes for the 2mEPSPS, AAD-12 or PAT proteins. The conventional soybean seeds were provided by the Department of TPD in Dow AgroSciences (Table 1).

Cloning and Characterization

Genomic DNA sequences of the flanking border regions for DAS-44406-6 soybean and sequences for the estimated parental locus in soybean variety Williams 82 were obtained from the Dow AgroSciences Trait Product Development group (Zhou and Novak, 2011 unpublished).

Reference Substance

The 1 Kb Plus DNA Ladder (Invitrogen) was used as a reference substance to estimate the size of PCR amplified products. The marker contains a mixture of DNA fragments with different sizes to serve as a size reference.

Genomic DNA Extraction and Quantification

Genomic DNA was extracted from freshly ground leaf tissues using a modified CTAB method. Following genomic DNA extraction, DNA samples were dissolved in 1× TE (10mM Tris pH8.0,

1mM EDTA, Thermo Scientific) and quantified with the PicoGreen method according to manufacturer's instructions (Invitrogen). For PCR analysis, DNA samples were diluted with molecular biology grade water (Promega) to result in a concentration of 100 ng/ μ L.

PCR Primers

Primers used for cloning the insert and its flanking border regions in DAS-44406-6 are marked in Figure 2 and their sequences were listed in Table 1 in the Confidential Appendix. The sequence of the estimated parental locus in William 82 was used to design primers as marked in Figure 3 for cloning the parental locus in Maverick and their sequences were listed in Table 2 in the Confidential Appendix. All primers were synthesized by Integrated DNA Technologies, Inc (Coralville, IA) and were dissolved in 1 \times TE (Thermo Scientific) to a concentration of 100 μ M as the stock solution.

Conventional PCR

Standard PCR was used to clone the insert and border sequences of DAS-44406-6 soybean as well as the insertion site in the host genome. The *TaKaRa EX Taq* PCR Kit (TaKaRa Bio Inc.) was used for conventional PCR amplification according to the manufacturer's recommended procedures. Specific PCR conditions and amplicon descriptions for DAS-44406-6 and for Maverick are listed in Table 2 and Table 3 respectively.

PCR Product Detection and Purification

PCR products were inspected by electrophoresis with a 1% agarose gel. Fragment size was estimated by comparison with the DNA markers. All PCR fragments were purified using the QIAquick Gel Extraction Kit following the manufacturer's instructions (Qiagen).

Sub-cloning of PCR Products

PCR fragments were sub-cloned into the pCR4-TOPO[®] vector using TOPO TA Cloning[®] Kit for Sequencing (Invitrogen) according to the product instructions. Specifically, two micro liters of the TOPO[®] cloning reaction was transformed to ElectroMax DH10B electrocompetent cells (Invitrogen) following manufacturer's instruction. Plasmid DNA of cloned fragments were prepared using the QIAprep Spin Miniprep Kit (Qiagen) followed by verification using restriction digestion with *EcoR I* or PCR (New England Biolabs). PCR fragments cloned for sequencing of the DAS-44406-6 soybean (Figure 4), as well as insertion site in host genome (Figure 5).

DNA Sequencing

After verification, selected colonies were sequenced initially to confirm that the expected DNA fragments had been cloned. The confirmed colonies were then selected for complete double-strand full length sequencing by primer walking. All sequencing was performed by Beckman Agencourt (Danvers, MA) with a minimum score of Phred 40.

DNA Sequencing Analysis

Final assembly of insert and border sequences was done using Sequencher[®] software (Gene Codes Corporation). Annotation of the insert and its flanking border sequences of DAS-44406-6 soybean were done with Vector NTI (Version 11, Invitrogen).

Homology search was performed in-house using the BLASTn program against the soybean scaffold sequence collection, a sequence assembly of soybean genome from William 82 (Schmutz *et al.*, 2010). Open reading frame (ORF) analysis using Vector NTI was performed to identify ORFs (≥ 450 bp, 150 aa) spanning the junctions between the insert and its flanking borders. All the BLAST search output results are included as electronic Appendix supplemental to the report. These files are electronically stored in a secured computer in Dow AgroSciences and are available for view in PDF format.

RESULTS AND DISCUSSION

T-DNA Insert and Flanking Border Sequences

The 5' and 3' flanking border sequences obtained from TPD and the expected T-DNA sequences from plasmid pDAB8264 were used to design the PCR primers listed in Table 2 and Confidential Appendix Table 1. Using these primers and conventional PCR, the entire T-DNA insert and over 1kb each of the flanking border regions were cloned from DAS-44406-6 soybean. In total, eight overlapping DNA fragments (Amplicons 1 to 8) were cloned and sequenced (Figure 2). The whole insert and flanking border sequences were assembled based on the overlapping sequences among the eight fragments, resulted in a total of 13659 bp of DAS-44406-6 soybean sequences. The cloned sequences are comprised of 1494 bp of 5' flanking border sequence, 1885 bp of 3' flanking border sequence, and 10280 bp of T-DNA insert (Figure 6 and Confidential Appendix Figure 1).

Sequence analysis of the whole insert and its flanking borders revealed a 3-bp insertion at the 5' integration junction of the T-DNA insert in DAS-44406-6 soybean (Confidential Appendix Figure 3). Sequence comparison between the insert and its counterpart in pDAB8264 confirmed that the T-DNA integrated in DAS-44406-6 soybean, including the three intact PTUs, is identical to the ones in plasmid pDAB8264. Sequence analysis did not reveal any novel open reading frames (≥ 450 bp, 150 aa) spanning the junctions resulting from the T-DNA insertion (Figure 6A).

A BLASTn search of both the 5' and 3' border sequences indicated a 99% identity with a segment of Chromosome 6 in a soybean scaffold sequence collection, a sequence assembly of soybean genome from William 82 (Genbank Accession: CM000839.1). However, no coding sequence and regulatory elements are defined in this segment according to current annotations of this accession.

Confirmation of the Parental Soybean Genomic Sequences

Based on the preliminary BLASTn search of the flanking borders of DAS-44406-6 against the soybean genome sequence of William 82, there is likely a deletion from the Maverick genome in DAS-44406-6 soybean. Confirmation of the insertion site in the soybean genome was obtained by PCR amplification of flanking border sequences and the parental locus in the unmodified soybean Maverick. Five overlapping DNA fragments (Amplicons 1 to 5) were cloned and sequenced (Figure 5), representing 7765 bp of Maverick genomic sequence. A BLASTn search of the parental locus sequence against the soybean sequence database used in the analysis of border sequences revealed a 99% identity to the same segment of Chromosome 6 (Genebank Accession: CM000839.1) as identified in the flanking border sequences. Sequence alignment of the parental locus in Maverick with the full sequence of the insert and its flanking borders described above confirmed deletion of a 4383 bp fragment from the parental locus at the insertion site in DAS-44406-6 due to T-DNA integration (Figure 6B and Confidential Appendix Figure 3).

An open reading frame of 777 bp (≥ 450 bp, 150 aa) was identified within the 4383 bp deleted segment (Figure 6B). However, further BLASTp search of this ORF against the GenBank non-redundant protein sequences have not identified any sequence similarity to known proteins.

CONCLUSIONS

In conclusion, 13659 bp of insert and flanking border sequences in DAS-44406-6 soybean and 7762 bp of parental locus in Maverick were cloned and sequenced (Confidential Appendix Figure 1 and Figure 2). The resulting sequence revealed a three base pair insertion at the 5' integration junction in DAS-44406-6 soybean event. The insert contains a single intact copy of the T-DNA identical to the counterpart from pDAB8264. PCR analysis combined with BLASTn searches confirmed that the cloned 5' and 3' flanking border sequences were indeed from the soybean genome and that a 4383 bp deletion at the insertion locus occurred as a result of the T-DNA integration. According to currently available sequence information, no indication of endogenous gene or regulatory element disruption or deletion is present at the integration locus.

ARCHIVING

The protocol for genomic DNA extraction, raw data and the original version of the final report will be filed in the Dow AgroSciences LLC archives at 9330 Zionsville Road in Indianapolis, IN 46268-1054.

¹Each PCR reaction was conducted using 100 ng of Maverick genomic DNA template in 50 µL total volume with 2 µL of each primer (10µM), 5 µL dNTPs (2.5mM each), 5 µL EX Taq Buffer, 10x conc. with MgCl₂, 34.25 µL water and 0.75 µL EX Taq Enzyme Mix. PCR reaction conditions were as follows: Initial denaturation – 2 minutes at 95°C; 35 cycles at 95°C – 1 minute, 56°C – 1 minute, 72°C – Amplicon specific*; final elongation – 7 minutes at 72°C; hold 4°C. Bands were then resolved on a 1% agarose gel in order to determine if the appropriate band was amplified.

* For Amplicon 1 and 4 extension time at 72°C -3 minutes. Amplicon 2 and 3 extension time at 72°C -30sec, Amplicon 5 extension time at 72°C -2 minutes.

The schematic diagram depicts the primer locations and cloning strategy for full length sequencing of the DAS-44406-6 soybean from 5' to 3' borders. The cloning and sequencing resulted in 1494 bp of 5' flanking border sequence, 1885 bp of 3' flanking border sequence, and 10280 bp of T-DNA insert.

The schematic diagram depicts the primer locations and cloning strategy for the corresponding parental locus of the DAS-44406-6 insert in Maverick. The cloning and sequencing resulted in 1494 bp of 5' flanking border sequence, 1885 bp of 3' flanking border sequence, and 4383 bp of the estimated deleted region by T-DNA insert.
