My submission asks that for application A1274 for the GM banana be denied as there is insufficient evidence of its safely profile for human consumption and ongoing health effects on population. Please see reasons below.

- There is no analysis of seven new unidentified proteins in the GM banana and no research on the implications of these proteins for food safety when the banana is eaten
- There is no safety evidence to show the GM banana will be safe for vulnerable people: infants, children, the sick or elderly.
- There is no safety evidence to show it will be safe for people who are on medications which change how the body reacts.
- There are no diagnostic tests for health professional to rule out any health effects from eating the GM banana.
