**Submission on Application A1261**

Seeds subject to radiation are adversely impacted by it. Seed germination and seedling growth are negatively affected by radiation. The simple fact is radiation can damage genetic structure, which is why bacteria die when subject to x-rays. The genetic structure of food subject to x-rays can also be damaged and therefore the health of anyone eating that genetically damaged food can be adversely impacted. Irradiation of food intended for consumption should never be allowed.
