

I would be very concerned about Hempseed oil coming in from China and other countries as I have known of some people complaining about quality and containing THC . It makes you wonder how it got through customs tests.

I myself have imported from China , but it is definitely not recommended for human consumption as qualities can be erratic and there is no control of production . If oil /seed was imported for consumption, it would need to be well tested .These analysis tests would need to be improved on the current testing on imported oils.

I believe that labelling could prove to be misleading if hemp food suppliers used the Hemp leaf image in marketing as this is the main image that the population relates to drugs . There are a few ways to think here ...on the other side of thinking , if the leaf was used , maybe over a few generations the instant drug related reaction would dissipate.

We at *GREEN HEMP AUST* have never used the leaf image in 20 plus years because most of the population thinks it is immediately drug related .

If legislation passes , maybe labelling for hemp food should be submitted to an organisation and passed before being allowed into the market so people are not mislead in any way .

I have mainly noted in this email the very few negatives , above , that need to be watched out for .

PLEASE NOTE : There are an enormous amount of positives that outweigh the negatives of legislation change ..

I believe that introduction of hemp for food in Australia (when grown in AUST) would make us a healthier nation , it would help farmers and very importantly our environment & farmland ..

Hope this helps with a smooth legislation change , please ask for any info needed .

Please keep me informed of the process as we intend to supply AUSTRALIAN hempseed oil / hemp for human consumption in Australia as soon legislation is changed .

Kind regards ,

Colin Buckler Sonja Parkinson
